Fact-check of WP-008 external claims: 10 of 22 figures are wrong

Of the 22 discrete external claims verified in ContextKeeper WP-008 v1.1, only 8 are fully accurate, 4 are approximately correct with important caveats, and 10 are materially wrong or unverifiable. The marketplace commission benchmarks are solid, but competitor pricing is stale, the SaaS benchmark citations include at least two reports that appear not to exist, and the BYOI pricing guidance attributed to BVP and a16z cannot be traced to any published source. Several figures—LangSmith, W&B, Auth0—are off by factors of 2× to 20×. This report details every finding with source classifications and recommended corrections.

Topic 1: Four of six competitor prices need updating

GitHub Copilot at $10/month — ✅ VERIFIED, but the tier name has changed. The plan formerly called "Individual" is now **"Copilot Pro"** at $10/month (Saaspricepulse) ($100/year). (Visual Studio Magazine) GitHub also added a **Pro+** tier (GitHub) at $39/month (Userjot) and a **Free** tier (launched December 18, 2024) offering 2,000 completions and 50 chat messages per month at zero cost. (PE Collective) The free tier is a significant competitive development (Saaspricepulse) the document should address prominently. Business remains $19/user/month and Enterprise $39/user/month. (GitHub +4) [vendor documentation: github.com/features/copilot/plans]

Linear at $8/user/month — ❌ INCORRECT on both tier name and price. Linear has no "Plus" tier. Its paid tiers are **Free → Basic ($10/user/month billed annually) → Business ($16/user/month) → Enterprise (custom)**. (linear) The $8/user/month figure appears to reflect outdated pricing; third-party aggregators referencing $8 likely cached an earlier price. The correct comparable figure is **$10/user/month** for Basic (annual billing). [vendor documentation: linear.app/pricing]

LangSmith Developer at $49/user/month — ❌ MATERIALLY INCORRECT. The LangSmith Developer tier is **free ($0/seat/month)**, not $49. The paid tier is called **Plus at $39/seat/month** (langchain) (Margindash) (not $49). The pricing structure is now usage-tiered: Developer gets 5,000 base traces/month free; Plus gets 10,000 with extended retention. (langchain) (LangChain) There is no tier priced at $49. This figure appears to be entirely wrong—possibly confused with an older or different product. [vendor documentation: langchain.com/pricing]

Weights & Biases Teams at $49/user/month — ❌ INCORRECT on both tier name and price. W&B has no "Teams" tier. Following the **CoreWeave acquisition in May 2025**, (PitchBook) the paid tier is called **Pro, starting at $60/month** (wandb) (not $49/user/month). Some third-party aggregators list $50/user/month for a "Teams" tier, possibly reflecting pre-acquisition pricing. (Aisotools) The official W&B pricing page as of March 2026 shows $60/month for Pro. [vendor documentation: wandb.ai/site/pricing]

Jira Standard at $8.15/user/month — ❌ APPROXIMATELY WRONG. Jira Standard pricing varies by user count and billing frequency: roughly **$7.50–$9.05/user/month** depending on team size. (CostBench) For annual billing with 1–10 users, the effective rate is $7.50/user/month ($900/year). (Vendr) For monthly billing at ~100 users, it's approximately $9.05/user/month. (Tech.co) The $8.15 figure does not match any documented current price point, though it falls within the range. Atlassian also introduced **Maximum Quantity Billing** in mid-2025, which bills at peak user count with no mid-cycle credits. (Saas CRM Review) [vendor documentation: atlassian.com/software/jira/pricing; practitioner evidence: CostBench, Tech.co verified Feb 2026]

Notion at $10/month — ✅ VERIFIED. The Plus tier is $10/member/month (annual billing) or $12 monthly. (notion) (Vendr) One important caveat: as of May 2025, Notion bundled full AI features exclusively into the **Business tier ($20/member/month)**, so the Plus tier now only includes a limited AI trial. (alfred_) [vendor documentation: notion.com/pricing]

Topic 2: All four marketplace commissions are accurate

GitHub Marketplace at 5% — ✅ VERIFIED. GitHub reduced its transaction fee from 25% to 5% on **February 4, 2021**, per an official GitHub Blog announcement. (github) The 5% rate remains current with no subsequent changes. (GitHub) [vendor documentation: github.blog/2021-02-04-github-reduces-marketplace-transaction-fees]

Salesforce AppExchange ISVforce at 15% — ✅ VERIFIED. The ISVforce Checkout rate is **15% of net revenue**, (Magicfuse) confirmed by Salesforce Developer Docs, Trailhead, and the ISV Starter Pack. An additional $0.30/transaction Stripe fee applies for credit card payments. (Salesforce Developers) Note that the OEM Embedded rate is higher at 25%, and volume discounts reduce the ISVforce rate to 10% for partners exceeding $20M in revenue share. (Magicfuse) [vendor documentation: developer.salesforce.com/docs]

Shopify App Store at 0% to $1M then 15% — ✅ VERIFIED with important nuance. As of **January 1, 2025**, the $1M threshold changed from an annual reset to a **lifetime cap**. Developers pay 0% on the first $1M earned from January 1, 2025 onward, then 15% permanently after. (Shopify) (shopify) Large developers ($20M+/year or $100M+ gross company revenue) pay 15% on all revenue with no exemption. (shopify) A **2.9% processing fee** applies on all transactions. (Shopify) (shopify) Unregistered developers default to 20%. (shopify) The WP-008 description of "lifetime" is correct for the current policy. [vendor documentation: shopify.dev/docs/apps/launch/distribution/revenue-share]

Atlassian Marketplace Connect/Forge rates — ✅ VERIFIED. The January 2026 restructuring is confirmed. Connect apps moved from 15% to **20%** on January 1, 2026, rising to **25% on July 1, 2026**. Forge apps moved to **16%** (rising to 17% in July 2026) with **0% on the first $1M in lifetime Forge revenue**. (Atlassian) (atlassian) One detail the document should add: the Forge rate also increases to 17% in July 2026, and the 0% incentive is described as "temporary." (Atlassian)

(atlassian) [vendor documentation: atlassian.com/blog/developer/updates-to-marketplace-revenue-share-2026]

Topic 3: SaaS benchmarks have serious sourcing problems

OpenView 35% annual conversion for bottom-up SaaS — ❌ UNVERIFIABLE, LIKELY FABRICATED. The 2024 SaaS Benchmarks Report exists (produced by **High Alpha** in partnership with OpenView, Paddle, and Tremont, surveying 800+ companies), but it focuses on growth rates, NRR, and AI monetization—not free-to-paid conversion. (Highalpha) Earlier OpenView Product Benchmarks (2020, 2022) showed **median free trial conversion of ~17%** and freemium conversion of ~5%. (Encharge) The ChartMogul/Kyle Poyar SaaS Conversion Report (2025) found **median free-to-paid of 8%** across self-serve products, with credit-card-required trials at 25–35% considered "good." No OpenView publication contains the specific "35% median annual upfront conversion" claim. **Recommend removing or replacing this citation.** [practitioner evidence: multiple benchmark reports cross-referenced]

OpenView NRR median 108%, best-in-class 118%+ for developer tools — ⚠️ PARTIALLY VERIFIABLE. General NRR benchmarks from OpenView/Kyle Poyar hover around **110% for public SaaS** companies, (HubiFi) making 108% a reasonable ballpark. However, OpenView segments by ARR band and company type—**not by "developer tools" as a category**. The "118%+ best-in-class for developer tools" breakout cannot be traced to any OpenView publication. KeyBanc's 2024 Private SaaS Survey places elite NRR at **115–125%**. (getmonetizely) The general NRR range is approximately right; the developer tools attribution is unverifiable. [practitioner evidence: Growth Unhinged, ChartMogul, KeyBanc]

Paddle 2025 Developer Tools Report (32% conversion, 28% trial conversion) — ❌ REPORT DOES NOT EXIST. Extensive searching of Paddle's website, blog, and third-party references finds no "Paddle 2025 Developer Tools Report." Paddle publishes monthly SaaS market reports and co-branded the 2024 benchmarks with High Alpha, but does not publish conversion rate benchmarks segmented by price point or product category. **Both the 32% and 28% figures are unsourceable.** The figures themselves fall within plausible ranges for well-performing products, but they cannot be attributed to Paddle. **Recommend removing these citations entirely.** [no source found]

Annual subscribers 3–5× lower churn — ❌ OVERSTATED; 2–3× is better supported. ProfitWell data (from ~2,500 companies) showed companies with predominantly annual contracts having roughly one-fifth the churn of predominantly monthly companies, but this compares *company-level aggregates*, not individual subscriber behavior within the same company. Subscriber-level data from Buffer shows a **~2.9× ratio**. Multiple industry sources (Monetizely, Marketers United, Baremetrics) consistently cite **2× to 3×** as the benchmark. The 3–

5× range overstates what most reliable subscriber-level data supports. **Recommend correcting to "2 to 3 times."** [practitioner evidence: ProfitWell, Baremetrics, Buffer internal data]

Trial conversion 25–40% for 14-day developer SaaS — ❌ OVERSTATED by ~10 percentage points. This range describes top-quartile to elite performance, not "typical" rates. First Page Sage (86 SaaS companies, through Q3 2025) reports opt-in free trial conversion at **18.2%** average. OpenView Product Benchmarks show **~17% median** for free trials. Encharge ChartMogul's 2025 report shows credit-card-required trials at 25–35% as "good." Critically, developer-focused products tend to convert at **lower rates** than average. The realistic typical range for opt-in 14-day trials is **15–25%**, and developer tools specifically may be lower. **Recommend correcting to "15 to 25%."** [practitioner evidence: First Page Sage, ChartMogul, OpenView, Userpilot]

Topic 4: The BVP/a16z private cloud pricing claim is unsourced

BVP and a16z 3×–7× guidance with 5× median — ❌ UNVERIFIABLE, LIKELY FABRICATED. Neither Bessemer Venture Partners nor Andreessen Horowitz publishes specific private cloud license pricing multiples. BVP's published materials (Cloud 100 Benchmarks, State of the Cloud, "10 Laws of SaaS") focus on valuation multiples and operational benchmarks— Bessemer Venture Partners not self-hosted pricing guidance. a16z's pricing content (Jennifer Li/Martin Casado's "Bottom Up Pricing & Packaging," Steven Sinofsky's work, their Pricing & Packaging hub at a16z.com/pricing-packaging/) covers tiered and usage-based pricing strategies but contains no 3×–7× self-hosted multiplier guidance. Traditional on-premise software used perpetual license + ~22% annual maintenance, Arena and some vendors charge 2–3× for self-hosted versus SaaS, but no authoritative VC source publishes the specific range claimed. **Recommend removing the BVP/a16z attribution and citing actual vendor precedents instead.** [no source found]

Topic 5: Auth0 pricing is off by 20×, Twilio is verified

Auth0 per-MAU at $0.0035 — ❌ WRONG BY A FACTOR OF 20. Auth0 (now part of Okta) still uses per-MAU pricing, confirming the model is correct, but the numbers are drastically off. The lowest paid tier (B2C Essentials) costs **$35/month for 500 MAUs,** Auth0 an effective rate of **$0.07/MAU**—twenty times higher than the claimed $0.0035. In late 2023, Auth0 implemented a ~300% per-MAU increase on B2C Essentials (from $0.023 to $0.07). SSOJet The free tier was expanded to 25,000 MAUs in September 2024. SSOJet **The $0.0035 figure has no basis in current or recent Auth0 pricing.** [vendor documentation: auth0.com/pricing]

Stripe effective per-user rate of $0.20–$0.80 — ⚠️ PLAUSIBLE BUT NOT A PUBLISHED METRIC. Stripe's standard pricing remains **2.9% + $0.30** per successful card charge. Swipesum Growlio The $0.20–$0.80 "effective per-user" figure is a derived calculation that depends entirely

on assumed transaction sizes and frequencies. For a single $10 transaction, the fee is $0.59; for a $5 transaction, $0.445. The math works under narrow assumptions, but Stripe does not publish per-user rates, and presenting this as a benchmark is misleading. [vendor documentation: stripe.com/pricing]

Twilio per-active-user Conversations pricing — ✅ VERIFIED. Twilio Conversations API charges **$0.05 per active monthly user** (pay-per-use), with $0.25/GB for media storage and standard messaging rates on top. Twilio Volume discounts are available above 20,000 active monthly users. Twilio This remains a relevant per-user pricing benchmark. [vendor documentation: twilio.com/en-us/messaging/pricing/conversations-api]

Topic 7: Critical gaps the document should address

GitHub Copilot Free reshapes competitive positioning. The December 2024 launch of GitHub Copilot Free (2,000 completions + 50 chat messages/month, no credit card required, available across VS Code, Visual Studio, JetBrains) establishes a new zero-cost baseline in the market. PE Collective With **76% of developers now using AI coding assistants but only 31% paying** (Stack Overflow 2025), OpenAIToolsHub freemium is now table stakes for any developer tool. Saaspricepulse The document's competitive pricing comparison should prominently note this free tier and its implications for ContextKeeper's own free-to-paid conversion assumptions.

AI coding tool pricing has evolved significantly. Cursor ($20/month Pro), Aitooldiscovery Windsurf ($15/month Pro), Aitooldiscovery Windsurf and Amazon Q Developer ($19/user/month Pro) Constellation Research have established a **$10–20/month individual tier** as the market standard. Cursor's controversial June 2025 shift from request-based to credit-based billing (effectively cutting usage by ~55% at the same price) triggered developer backlash and migrations to Windsurf. Aitooldiscovery Windsurf was acquired by Cognition AI for ~$250M in late 2025. Taskade Sourcegraph Cody discontinued individual plans entirely, focusing on enterprise at $59/user/month. **Credit-based pricing is emerging as the dominant model** for AI tools, but requires extreme transparency.

AI observability tools are all priced above ContextKeeper's $12/month Pro. Every major LLM observability platform's lowest paid tier exceeds $12/month: Langfuse Core at **$29/month**, Comparateur-IA Checkthat Portkey Production at **$49/month**, portkey Arize AX Pro at **$50/month**, Point of AI and Helicone Pro at **$79/month**. helicone LinkGo All four offer free tiers with meaningful capabilities. This positions ContextKeeper's $12/month Pro as **significantly cheaper than the observability tool market**, which either supports aggressive penetration pricing or suggests the document's pricing is too low relative to the value these tools provide.

The $12/month and $29/user/month price points are well-supported by precedent. GitLab Premium sits at exactly **$29/user/month**. Snyk Team is **$25/month per developer**. SonarQube Developer Edition is approximately **$12.50/month**. Developer tool pricing research (Monetizely,

400+ platforms) shows Getmonetizely Pro tiers at $10–25/user/month and Team/Business tiers at $30–50/user/month. Getmonetizely ContextKeeper's proposed pricing sits comfortably within established norms.

New benchmark reports available. The **Maxio/Benchmarkit 2025 SaaS Pricing Trends Report** (500+ companies) found that hybrid models (subscription + usage) report the **highest median growth rate at 21%**, and that **44% of SaaS companies now charge for AI features**. Multi-year agreements now account for **40% of SaaS agreements**, up from 14% in 2022. The **ChartMogul 2025 Growth Report** found AI-native startups are **3× more likely** to reach $1M ARR in 6 months. ChartMogul These reports provide more current and verifiable benchmarks than the OpenView and Paddle citations currently in the document.

Usage-based pricing adoption continues to climb but hybrid dominates. As of 2025, **67% of SaaS companies** leverage usage or consumption-based pricing Global Publicist 24 (up from 52% in 2022), but pure usage-based models underperform. Companies using **hybrid subscription + usage** models outperform on growth. OpenView's historical data shows multi-dimensional pricing models (3+ pricing dimensions) correlate with **34% higher LTV/CAC ratios.** getmonetizely The document's proposed combination of per-seat subscription with usage-based elements aligns with this trend.

Consolidated verification scorecard

#	Claim	Verdict	Correction needed
1	GitHub Copilot $10/mo	✅ Accurate	Update tier name to "Pro"; add Free and Pro+ tiers
2	Linear Plus $8/user/mo	❌ Wrong	No "Plus" tier; Basic is $10/user/mo
3	LangSmith Developer $49/user/mo	❌ Wrong	Developer is free; Plus is $39/seat/mo
4	W&B Teams $49/user/mo	❌ Wrong	No "Teams" tier; Pro starts at $60/mo
5	Jira Standard $8.15/user/mo	❌ Approximately wrong	Range is $7.50–$9.05 depending on size/billing
6	Notion $10/mo	✅ Accurate	Note AI features now require $20/mo Business tier
7	GitHub Marketplace 5%	✅ Accurate	—

#	Claim	Verdict	Correction needed
8	Salesforce AppExchange 15%	✅ Accurate	—
9	Shopify 0%→$1M→15%	✅ Accurate	Note $1M changed from annual to lifetime in Jan 2025
10	Atlassian Connect 20%→25%	✅ Accurate	Add: Forge also rises to 17% in Jul 2026
11	OpenView 35% conversion	❌ Unverifiable	No such figure in any OpenView report; remove citation
12	OpenView NRR 108%/118%	⚠️ Partial	General NRR ~110% plausible; dev tools breakout fabricated
13	Paddle 32% conversion report	❌ Report doesn't exist	Remove citation entirely
14	Paddle 28% trial conversion	❌ Unsourceable	Remove citation entirely
15	Annual churn 3–5× lower	❌ Overstated	Correct to 2–3× per industry consensus
16	Trial conversion 25–40%	❌ Overstated	Correct to 15–25% (developer tools may be lower)
17	BVP/a16z 3×–7× private cloud	❌ Unverifiable	Neither firm publishes this; remove attribution
18	Auth0 $0.0035/MAU	❌ Wrong by 20×	Current rate is $0.07/MAU (Essentials tier)
19	Stripe $0.20–$0.80/user	⚠️ Plausible	Not a published metric; label as derived estimate
20	Twilio per-active-user	✅ Accurate	$0.05/active user/month confirmed
21	ContextKeeper $12/$29 positioning	✅ Reasonable	Well within developer tool pricing norms
22	Atlassian Forge 16%/0% on $1M	✅ Accurate	Note 0% incentive is described as "temporary"

Conclusion: the pricing architecture needs a data integrity pass

The document's structural logic and marketplace commission data are sound, but **the**

competitor pricing section and SaaS benchmark citations need significant revision. Four of six competitor prices are wrong—two dramatically so (LangSmith Developer is free, not $49; langchain Margindash W&B has no Teams tier). wandb At least two cited reports (the "Paddle 2025 Developer Tools Report" and the OpenView "35% annual conversion" figure) appear to be fabricated or hallucinated. The BVP/a16z private cloud pricing attribution similarly cannot be traced to any published source. The Auth0 per-MAU figure is off by a factor of 20. SSOJet The churn and trial conversion benchmarks systematically overstate performance by roughly 40–60%.

The marketplace commission analysis is the document's strongest section—all four figures verified from primary vendor documentation. The proposed $12/month and $29/user/month price points are well-positioned relative to verified market comps Userjot (GitLab Premium at $29, SonarQube at ~$12.50, Snyk Team at $25). SaaSworthy The most important gap is the absence of GitHub Copilot Free from the competitive analysis, Visual Studio Code which fundamentally resets the competitive baseline for any developer-facing tool Futurum Group launching in 2026. PE Collective Saaspricepulse
